SUMMARY

Backend & Platform Engineer specializing in building the foundational systems that enable products to scale and evolve. Over 11 years, built Toppr Answr to **150M monthly sessions**, architected the backend foundation for BYJU'S Future School, and built an enterprise analytics and AI platform from the ground up at GoHeartBeat.

TECHNICAL SKILLS

Languages	Go · Python · Node.js · SQL
Architecture & Systems	Distributed Systems · Microservices · System Design · Scalability · High Availability
Cloud & Infrastructure	AWS · Kubernetes · Terraform · CI/CD · Observability
Data & Messaging	PostgreSQL · ClickHouse · Elasticsearch · Redis · Neo4j · DynamoDB · Kafka
AI & Analytics	LLM Applications · MCP · RAG · Tool Calling · Evals · Semantic Modeling

EXPERIENCE

GoHeartBeat

Founding Engineer · Sep 2024 – Present

Architected and built the company's analytics platform, infrastructure, and AI capabilities from the ground up.

- Architected and built a **multi-source, multi-tenant** analytics platform that unified business data across enterprise systems.
- Architected the platform around a **semantic layer** that preserved business definitions independent of storage and applications, making them reusable across analytics and AI.
- Built a composable analytics platform from reusable building blocks, enabling new customer dashboards without extending the core platform.
- Architected a **hybrid deployment architecture** that ensured customer data remained within customer-owned infrastructure without increasing operational complexity.
- Extended the analytics platform with an **AI-powered analytics assistant**, enabling users to explore business data through natural-language questions beyond predefined dashboards using validated semantic-layer queries.

Tech: Python · CubeJS · ClickHouse · Kubernetes · Terraform · CI/CD · MCP · RAG · Tool Calling · Evals

BYJU'S

Principal Software Engineer · Aug 2022 – Aug 2024

Led backend platform engineering across BYJU'S Future School and WhiteHat Jr., building the Future School platform and systematically evolving WhiteHat Jr.'s backend.

- Architected the backend platform for BYJU'S Future School to unify the learning platforms across BYJU'S subsidiaries through domain-owned services.
- Built a common engineering library and platform services for authentication and communication, enabling teams to focus on business logic and build services consistently.
- At WhiteHat Jr., evolved the event-driven architecture through **durable asynchronous messaging**, making the backend easier to reason about while improving observability and resilience.
- Diagnosed infrastructure scaling delays as the primary source of recurring production incidents and designed predictive autoscaling to maintain application availability during demand spikes.
- Established an ROI-driven approach to prioritizing platform improvements, reducing recurring operating costs by over **\$120K/month** while maintaining production reliability.

Tech: Go · Node.js · Cassandra · SQS · Lambda · Kubernetes · OpenTelemetry · AWS

Toppr

Tech Lead · Dec 2019 – Jul 2022

Drove backend engineering across product, shared backend, and infrastructure engineering at Toppr.

- Architected and built the backend of Toppr Answr, scaling it into one of India's largest education platforms serving **150M monthly sessions, 35M monthly active users**, and generating 184K organic leads/month.
- Identified Python's runtime model as the limiting factor after exhausting application-level optimization options across queries, caching, and backend architecture. Led a phased migration from Django to Go, reducing compute requirements by **~90%** while significantly improving backend throughput.
- Strengthened Toppr's shared backend stack across caching, database access, repositories, and middleware, with improvements benefiting every product while reducing shared compute requirements by **~40%**.
- Systematically optimized infrastructure by identifying and eliminating inefficiencies across compute, databases, caches, and storage, reducing recurring AWS spend by **~\$80K/month**.
- Established Toppr Answr as the **benchmark for backend engineering**, influencing organization-wide migrations of Search as a Service and Doubts on Chat from Django to Go.

Tech: Django · Go · PostgreSQL · Redis · Neo4j · Elasticsearch · AWS

Transin Logistics

Senior Software Engineer · Jul 2017 – Nov 2019

Built backend systems and tools that simplified logistics operations.

- Built a backend financial integration with QuickBooks that automated financial workflows, reducing manual effort by 90% through reliable asynchronous processing.
- Worked directly with operations teams to translate day-to-day logistics workflows into backend systems, dashboards, and mobile tools that simplified operations and improved visibility.

Tech: Node.js · DynamoDB Streams · Kafka · QuickBooks API

Eclerx

Senior Analyst · Jul 2015 – Jun 2017

Built large-scale data processing systems for enterprise security analytics.

- Built a centralized security analytics platform processing logs from **~9,000** enterprise machines, introducing Kafka-based event buffering to reliably process high-volume log streams without event loss.

Tech: Kafka · Hadoop · Elasticsearch · Logstash · Kibana

EDUCATION

IIT Gandhinagar

B.Tech. in Chemical Engineering, Minor in Computer Science · 2011 – 2015
